

Weather Louvres

caice.co.uk

Our distinctive & efficient Weather Louvre system

Aerodynamic with high resistance to weather that's easy to assemble with our optional integrated steel work support system.

Visually attractive and versatile

Enhance your buildings appeal with our distinctive weather louvres disguising your unsightly plant. Balancing weather efficiency with aerodynamic performance protects your ventilation openings.

Being the only company in the UK that manufactures Weather Louvres, Continuous Line Acoustic Louvres and Attenuators in-house we will recommend the best performing and most cost efficient solution for your project.

One multi-purpose system with many applications

Weather Louvre applications include: fresh air intakes and exhausts for ventilation systems, mechanical equipment screens or enclosures, natural ventilation and façade cladding, all providing a seamless look wherever they are used.

For a totally individual appearance, the Weather Louvres are fabricated from extruded aluminium and can be finished in polyester powder paint to a wide range of RAL colours.

You can be confident in our performance testing

We like to do things properly and our Weather Louvre range has therefore been rigorously tested to offer performance data that you can trust. Applicable standards -

Rain Penetration, Pressure Drop and Coefficient of Entry - BS EN ISO 13030: 2001 (BSRIA). More detail on this test standard is available upon request.

Class A rainwater penetration

Rainwater will penetrate into a building through standard Weather Louvres. So we have developed a high performance option to achieve Class A rainwater penetration when tested at BSRIA (99% effective at 2.5m/s face velocity).

Supporting you every step of the way

We are always delighted to answer your questions and provide you with detailed specifications, design and pricing. If you have a complex project then we can develop products or design solutions to meet your specialist needs with our bespoke service.

Beautifully designed

All our contracts are drawn by skilled technicians, using AutoDesk Inventor, building accurate 3D models of the products, so all elements fit perfectly with each other and your building.

Continuous investment in automated manufacturing

Advanced technology is central to our Production facilities in Dorset. From automated engineering of component parts to high quality polyester powder painting for a durable and long lasting finish. We hate waste of all kinds and so continuously drive them out. Guaranteeing you the highest quality products, achieving your expectations and all delivered at the lowest possible cost.

Accurate installation, on time and budget

Our highly trained project managers will work with you to ensure our products are installed on time and to budget, even for the most challenging of projects.

The innovative assembly design of our Weather Louvres makes installation faster, helping to save vital time on site.

Weather Louvre applications

Our engineers will recommend the best solution for your project based on your specific application and requirements. Whether natural or mechanical ventilation is required, or if unsightly buildings or plant need 'hiding' from view.

The geographical location and height above sea level will also determine exposure to weather and wildlife which may require added protection.

Whatever your challenges, we'll have you covered.

Penthouse

Screen with door

Fresh air intakes and exhausts

With a robust aluminium profile this PLS 100 blade is commonly used for industrial purposes and large areas of louvre façade. It is expecially useful for plant screening, and when inverted this louvre provides screening of the plant

when viewed from below.

Louvre enclosure with door

Natural ventilation and façade cladding

Weather Louvre doors

Doors are available as both single and double leaf. There's an extensive range of furniture options to meet both your safety and security requirements. They are offered for active airflow or provided as dummy profiles with blanking.

Consider the weather

Louvre systems are designed to allow air to pass through the façade, either for inlet or outlet air ventilation requirements.

It is possible that under certain weather conditions, airborne rain will manage to pass through the louvre bank. The application of the louvre system and the prevailing circumstances will determine the severity of this issue. There are classifications in BS EN ISO 13030: 2001 to provide guidance for selecting the right louvre for your project in regards to the rain ingress. Panels of louvre are trialed on simulated rain test rigs, and are then classified in terms of their effectiveness at preventing rain from passing through the panel.

If it is highly important that rain is prevented from passing through the louvre system, a higher classification louvre should be selected, such as 'Class A'.

Penetration classes				
Class	Effectiveness	Maximum allowed penetration of simulated rain $\ensuremath{l/h.m^2}$		
А	1 to 0.99	0.75		
В	0.989 to 0.95	3.75		
С	0.949 to 0.80	15.00		
D	Below 0.8	Greater than 15.00		

Source: BS EN ISO 13030: 2001

Resistence to air flow

Penetration classes

The simulated wind and rain that the weather louvre is subjected to under the standard test is as follows:

Fan driven wind at a speed of 13 m/s (approximately 30mph) Water sprayed as rainfall at a rate of 75 l/h.

The amount of water collected behind the louvre is compared to that of a similar test conducted with the louvre removed completely. The effectiveness is the proportion of water rejected by the louvre.

The louvre under test is 1m x 1m in size and provides useful comparative data between different design profiles. It does not necessarily replicate the most severe of weather conditions or qualify the need for appropriate water collection and drainage.

Entry or discharge loss coefficient classes

The coefficient of discharge (C_D) or entry (C_E) compares the performance of the louvre against an ideal louvre with minimal air resistance. It is expressed as a single class based on an average result of the tests measuring the pressure differential between the outside and inside of the louvre, giving the resistance to airflow. The air resistance is rated in classes, with '1' indicating the least resistance and '4' the most.

Entry or discharge loss coefficient			
Class	Entry or discharge loss co		
1	0.4 to 1.0		
2	0.3 to 0.399		
3	0.2 to 0.299		
4	0.199 and below

efficient C _D

VertiBlade – created with designers and architects in mind

We were asked by an architect to help solve an issue with a new building on the Greenwich Peninsula in London. They calculated that the inherited steel work structure would not support the full weight of the brick work all the way to the top of the building and the architect's client wanted the sub-station transformers on the roof to be completely out of sight of the nearby school and residential properties.

This light-weight cladding system solved all the issues on-site

Following a couple of meetings with the architect, we came up with the idea of using the **VertiBlade** system so that the transformers would not be seen and without adding a heavy load to the supporting wall structure. In effect, adding a light-weight, visually attractive form of pervious cladding, when viewed from different angles at ground level.

CASE STUDY Greenwich Peninsula Sub-station

London

During the day, our **VertiBlade** provides a high definition profile, with crisp, clean lines and striking colour changes as the sunlight catches them. At night, this complete 3D screening to plant can turn into a light feature with an appropriate LED light system.

A detailed assessment was carried out by our acoustic experts

As the building was originally all brickwork there was no issue with noise breakout from the transformers. Acoustic experts at LCP, our sister company, carried out a detailed assessment of the plant to ensure that the noise levels at the school and residential properties were not going to be exceeded with the blade system proposed.

A meeting on-site with the local planners was arranged, where colour samples of the blades were handed over. The black ones, matching the colour of an adjacent building along with the results from the acoustic assessment, were subsequently approved in a new planning application.

A bespoke 3D corner section maintains the aesthetic appearance

Due to the way that the building had been designed, we developed a bespoke way of fixing the **VertiBlade** to the existing steel system that would align with the concrete stairwells at the end of the building. A special 3D section was also designed to create a crisp corner detail enhancing the aesthetic appearance of the system.

Because of the tight proximity of the site within its boundaries, it was crucial that the access equipment had the appropriate height and reach to deliver the installation contract.

A very happy client

Our client said afterwards, "the high level cladding has now been completed and Caice has undertaken a fantastic job. The detailing is crisp and all of the lines are straight and clean. Installing the top section the opposite way around has added definition to the profile and when the light catches it the colour changes are striking. I am very happy with the finished product."

Weather Louvre options

PLS 50 Weather Louvre **Technical Data**

Weather Louvre, Standard 50mm Pitch Profile, 50mm Blade Depth

Performance

Resistance to Airflow (C_e)

Typical weight with 50mm mullion at 1 metre centres - 16kg/m²

Generally louvres will be supplied in component parts for assembly on site. Joining brackets and fixings will be provided for assembly.

Installation services, support steelwork, flashings, fixings to the structure and mastic will not be provided unless stated.

Refer to the Weather Louvre Schedule and Product Code Definitions for the size and specification of each Weather Louvre.

A minimum of 10mm clearance should be allowed between the structure and the Weather Louvre sizes shown.
